Microbial contamination in hydrocarbon fuel can be a serious problem for storage tanks and equipment. It can cause serious fuel storage tank corrosion and corrosion in pumps and injectors. It will clog filters, fuel lines and gauges and will cause seals, hoses and connections to swell and blister. Early detection of contamination protects the fuel supply quality and prevents fuel supply waste.

The Hum-Bug Detector® Kit is a low-cost, easy-to-use early warning system that will effectively identify hydrocarbon utilizing micro-organism contamination in all hydrocarbon fuels and oils. These organisms cause fungal growth in fuels and the serious hazards associated with that growth. The Hum-Bug Detector® Kit will detect microbial contamination in its earliest stages if used with a concerted fuel quality control program.

In order to avoid problems with the fuel supply, the presence of these microbes must be detected and eliminated. Use the Hum-Bug Detector® Kit to identify the presence of these microbes and treat them with BioborJF®, a microbicide additive, to eliminate fuel supply contamination.

Fuel Additives equal a cleaner engine, better mileage, and fewer harmful emissions.
